

Climate change problem : Plastic waste

Aubin Gueudet Arthur Bomme
4^{ème} B

As you can see : in the sea
Plastic waste is a big problem which has the effect
of harming fauna and flora.

For the fauna : sea turtles

**Sea turtles think
that plastics are
sea jellyfish.
So they eat them
and die.**

For the flore : corals

Before pollution

During pollution

33% of marine life is present in corals

Essential food for the marine food chain.

27% of corals reefs have disappeared

To remedy this, we can start by stopping unnecessary packaging

At lunch, favor cakes without packaging

We can also pick up trash that are laying around the yard

Or, we could set up a club to go into the Lion d'Angers town to pick up trash

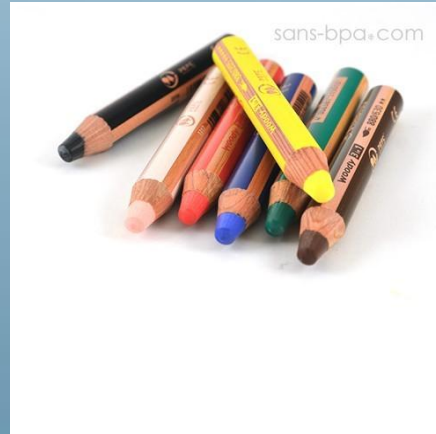

In school :

We must stop or replace plastic school supplies with other materials, such as :

**Replace plastic rulers
with Wooden rulers**

**Replace ink pens
with wooden pen**

**Stop plastic
correction fluids**
