

Arctic ice floe disappears !

The arctic pack ice continues to decrease.

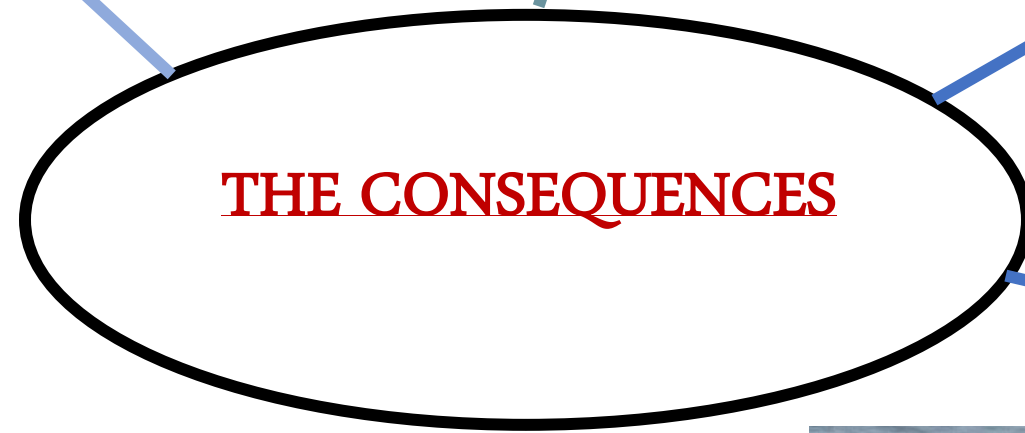

During the last 30 years, an area equivalent to six times France of the ice floe melted.

*Some species are in danger because of climate change.
For example : polar bears, seals, penguins and some species of fish*

*Rising water and temperature have consequences:
They disturb ocean currents*

*Appearance of certain species and disappearance of species :
In fjords, certain species of fish appear and others disappear*

The animals have less and less space to live.

THE ACTIONS THAT WE CAN TAKE AT SCHOOL AGAINST CLIMATE CHANGE

In school we have to put our garbage in the trash.

Do not consume too much energy.

Don't waste food and drinks.

A photograph of a person hugging a large tree trunk in a forest. The person's hands are visible on either side of the trunk, and a heart-shaped hole has been cut into the bark. The background shows a path leading through a forest of tall, thin trees.

END

*Good bye Justine and
Capucine 4°B*
